What factors we need to consider

ASO has 9 core areas that affect an apps performance on the app store. These consist of fundamentals that should be optimised to improve performance, as well as ongoing promotions such as brand mentions and consistent, positive reviews.

What areas need to be reviewed and optimised:

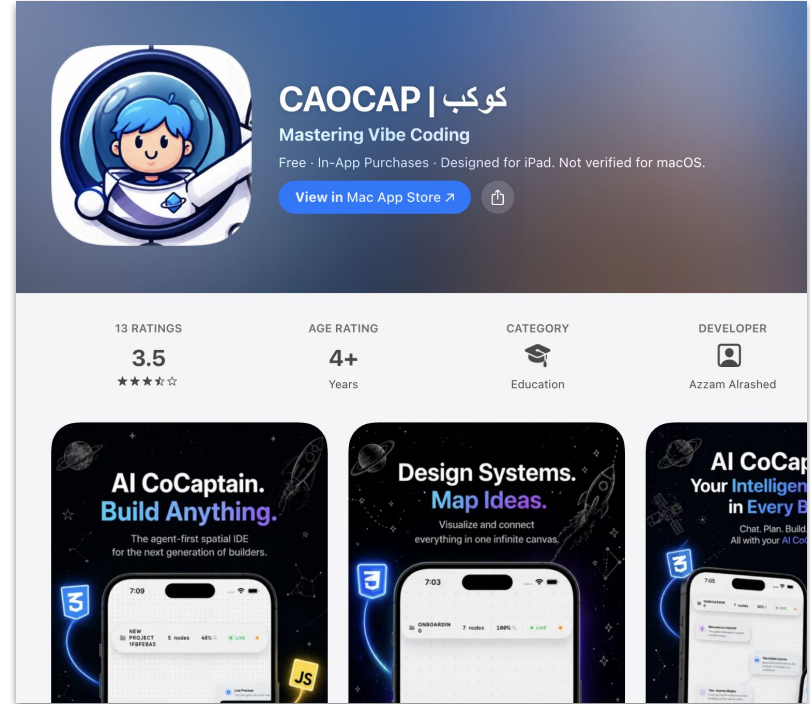

- Title
- Subtitle
- Description
- Screenshots and preview video
- Localization
- Category
- Ratings & engagement
- Mentions & brand consistency

Firstly, app localization

At present there is one version of the app available to all users, with the title in both english and arabic: CAOCAP - كوكب

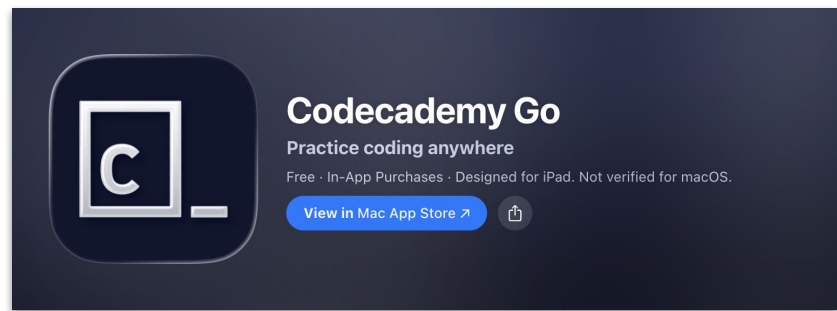

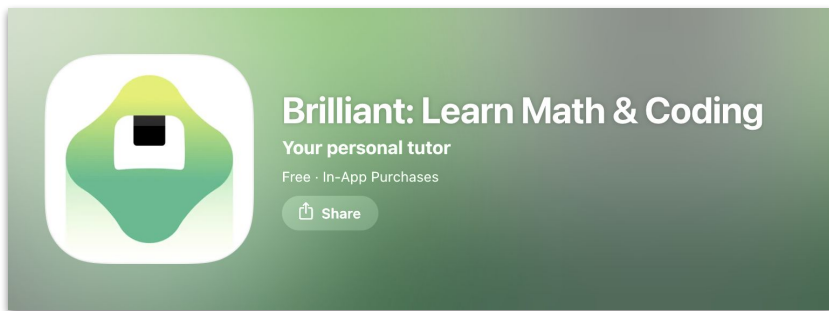

This is targeting both of your audiences, but will actually dilute its focus and negatively affect both. Within the app store, you have the option to create localized versions of the same page with unique content, META data and more. This needs to be done for the app to create both an english and arabic version with unique content for each.

Action: Create a native Arabic localized app, and remove any Arabic from the English version

App title + sub title

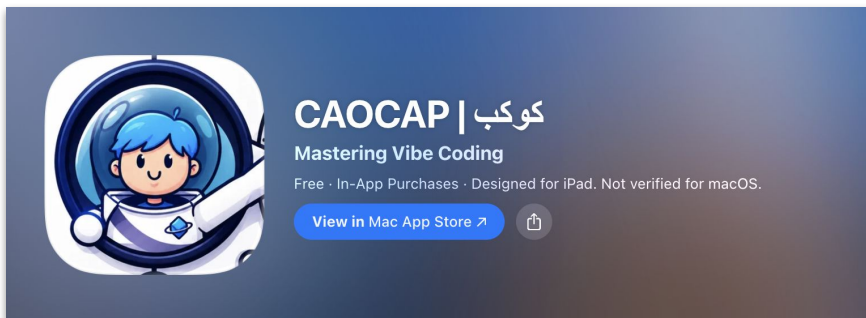

The title + sub title is one of the biggest ranking factors for app store performance. The brands you shared for instance are using:

App title + sub title

As a result, we need to include core search phrases people are looking for to connect your app to the relevant searches. I'd suggest:

Current:

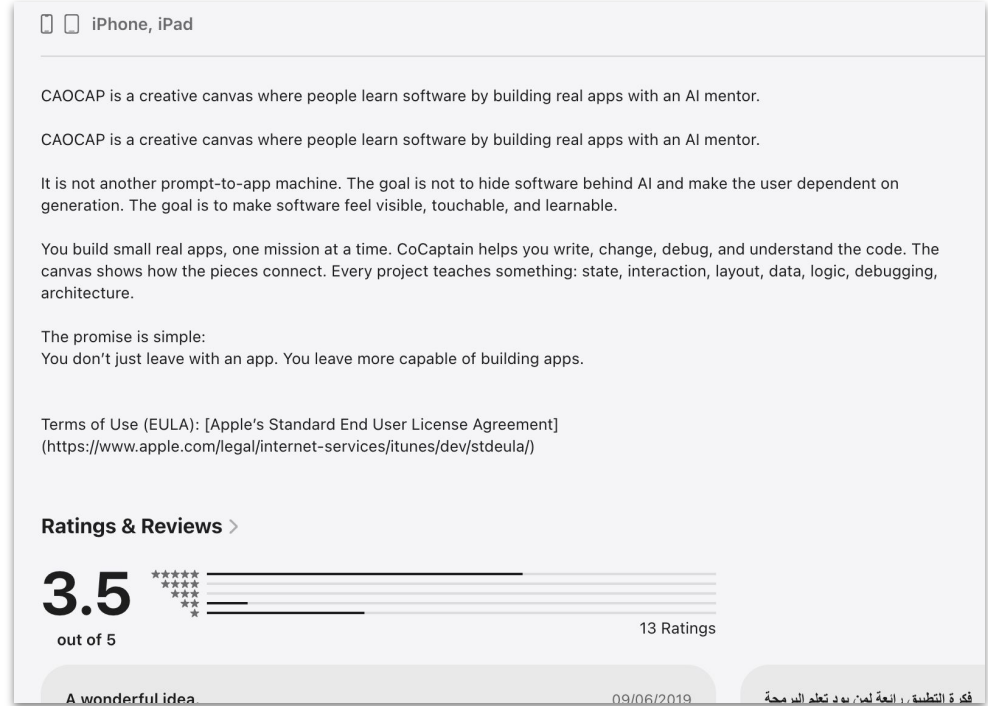

Suggested:

App description

Fix the duplicate opening line first, that's non-negotiable and unrelated to strategy.

Beyond that, restructure the order: open by naming the actual audience (creative builders, not aspiring engineers), state what they'll build (real Mini-Apps, not toy exercises), explain how CoCaptain helps (a mentor, not a generator), then a short feature list, then Pro.

App description (suggested)

CAOCAP is a creative canvas for building real software, one small project at a time. It's for designers, founders, students, and anyone with an app idea, no coding background required.

Inside CAOCAP, you build real Mini-Apps: small, working pieces of software you can run and see come to life, not toy exercises or throwaway demos. Each one teaches you something real, layout, state, logic, data, debugging, or architecture, right at the moment you actually need it.

CoCaptain is your mentor, not just a generator. It writes, edits, and debugs alongside you, but its real job is helping you understand what's happening underneath, so you leave every mission more capable than when you started. You don't just end up with an app. You end up better at building them.

What you get:

- A spatial canvas where you build, run, and inspect real projects
- Guided missions that teach one concept at a time, as you need it
- CoCaptain, an AI mentor that explains and edits code without taking over
- Instant live previews of everything you build

CAOCAP isn't another prompt-to-app tool that generates something for you and hopes it works. It's a way into software that stays yours the whole way through.

Unlock CAOCAP Pro for unlimited missions and full access to CoCaptain.

Keyword field targeting (App store connect)

Review and refine CAOCAP's Apple App Store keyword field to ensure the full 100-character allowance is being used efficiently. Prioritise relevant, high-intent search terms, remove duplicated words already used in the app title or subtitle, and identify additional keyword opportunities based on competitor visibility and search demand.

Suggested keywords:

vibe,coding,learn,code,ai,programming,beginner,lessons,course,practice,apps,tutorial,builder,prompt

The image shows a screenshot of the Apple App Store Connect interface. A tooltip is displayed over the 'Keywords' field, explaining that keywords describe the app and make search results more accurate, with a limit of 20 characters. The 'Keywords' field contains the text 'english,french' and 'ertificate,learn,lear'. Below it, the 'Support URL' field contains the text 'http://example.com'.

Keywords ? One or more keywords that describe your app. Keywords make App Store search results more accurate. Separate keywords with a comma. 20

english,french ertificate,learn,lear

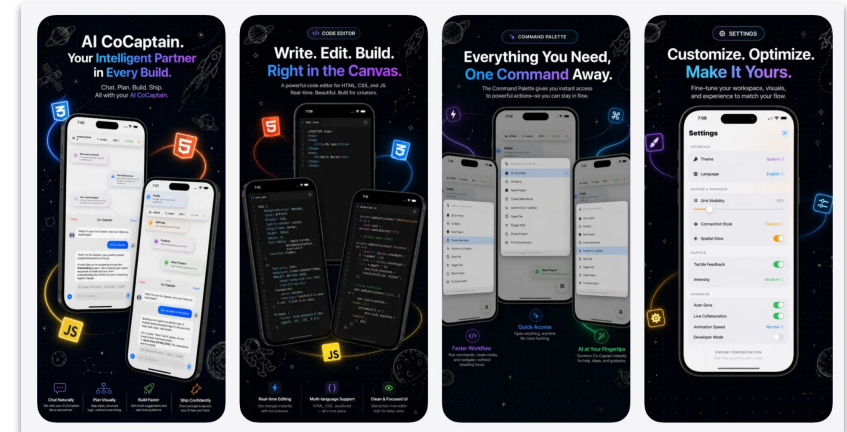

Support URL ? http://example.com

Screenshots & media

Recommendation: 6 screenshots + 1 preview video

Six well-made shots that each earn their place beats ten generic ones. Six also maps cleanly onto the mission loop already created, just compressed slightly:

- Hero shot: the canvas itself, mid-mission, headline overlay stating the core value ("Learn to build real apps, one mission at a time")
- Starting a real Mini-App, small and immediately runnable
- CoCaptain explaining a concept at the moment it's needed, mentor framing, not "type a prompt"
- Editing on the spatial canvas, showing how the pieces connect
- Live preview updating instantly as changes land
- The payoff: what a finished mission looks like, more capable, not just more apps

Screenshots & media (video)

Also recommend: one App Preview video, 15–30 seconds

CAOCAP currently has zero video on its listing. Apple requires it to be an actual on-screen recording, no rendered or marketing footage, so this needs to come straight from a device or simulator, not an edit.

Worth showing the loop end to end in miniature: open a mission, edit with CoCaptain, watch it update live. It also autoplays muted in search and browse, so unlike the screenshots, it does some of its work before anyone even taps through.

Ratings & engagement

Thirteen ratings won't move on its own. The fix is timing: trigger Apple's native review prompt at a clear win moment, most likely right after a user completes their first mission, rather than on launch or on a fixed schedule.

Don't chase volume through incentivized reviews, that's against App Store guidelines and it's also not necessary here; the app just needs to ask satisfied current users at the moment they're most likely to say yes.

The aim should be 50+ reviews minimum with a rating of 4.2 stars +

Tolkien Fans

The Programmer approached me in a mall, and told me about this application called caocap. Gave me a demonstration of how it works, and honestly I was taken aback. I still haven't discovered all it has to offer. But it's quite interesting. I'll tinker a bit [more](#)

Developer Response
Thank you so much for the wonderful review! I'm thrilled to hear that you found [more](#)

فكرة التطبيق رائعة لمن يود تعلم البرمجة

Features & updates

Each version should come with a detailed breakdown of what has changed and how this has improved the user experience.

Some of the updates have this, but most are very vague. Following a similar layout the the one flagged here, and this will help both ASO performance and potentially increase app downloads when people check this information.

Too vague

Perfect

A/B Testing

As a suggested ongoing optimisation you can make, I'd recommend split A/B testing and collecting data on the core aspects of the app page. This includes testing details such as:

- Icons
- Screenshots
- Videos
- Title/ sub-title

Agree on a good amount of test data (500 views?) and see which has the best conversion rate.

Version A

Version A

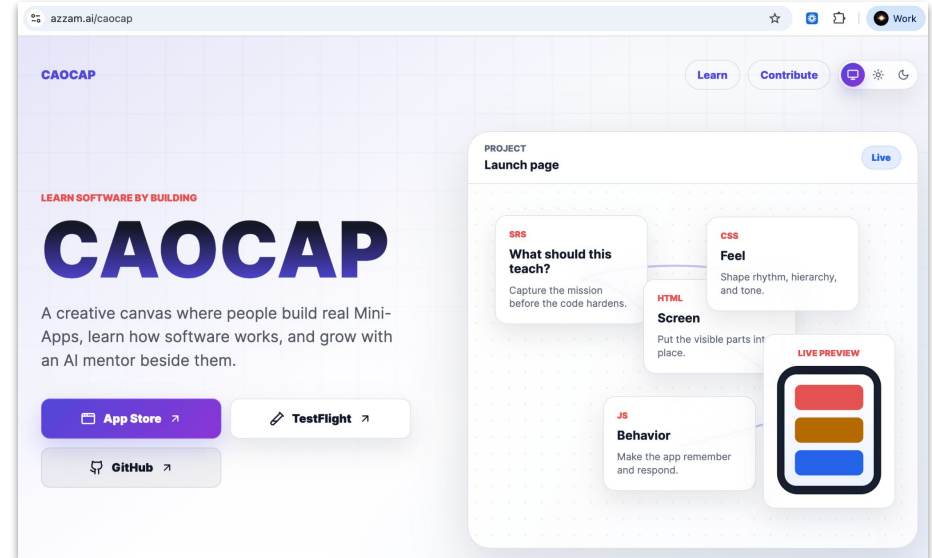

Brand website + listicles

External trust has a lot of impact on an app's performance. External trust can be built in 2 ways - a dedicated website for the app itself, and the app getting links and mentions from listings and publications in a relevant field.

The website domain does not match the app, so this will need a new domain/ website created.

The website should then focus on building educational content around the app/ its features to build credibility.

Next steps

Action	Priority	Effort
Create localized versions of the app (EN/AR)	High	Medium
Optimise keyword field	High	Low
Title + sub-title updates	High	Low
App description updates	Medium	Low
Split A/B test core aspects	Medium	Medium
Update screenshots + add video	Medium	High
Optimise version updates	Low	Low
Increase ratings + gain consistently	Highest	High
Create dedicated website + publish content	Medium	High
